

Coginiti Pro is your new secret to productivity - getting you out of the office earlier

Managed Personal Code Catalog with Version History and Version Compare

With Coginiti's active catalog, you can run, reference, and reuse curated analytic assets. Coginiti Pro automatically keeps a version history with all edits to your SQL assets, which are executable directly within the SQL editor.

Centralized Administration of User License Deployment

Seamlessly manage and distribute Coginiti Pro license keys across your department or organization. Choose whether you want to approve all users across your entire email domain or manually approve new user license requests. Licenses are automatically pushed to your users.

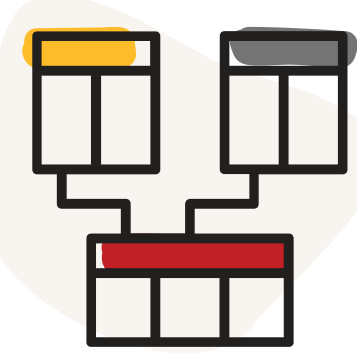

A Faster Way to Write SQL for Users of All Skill Levels

Coginiti's IDE goes beyond our cross-database autocomplete and deep database object integration — users also love the ability to quickly insert business logic, adjust parameters, and reuse curated (and dynamically updated) SQL with just a few keystrokes.

Easily Search Your SQL History and Catalog Assets

Spend less time rewriting lines of code. Your SQL is no longer locked in hard-to-locate files which thwart quick discovery and reuse. Coginiti Pro allows you to search across your entire SQL query history and Catalog assets to find and execute SQL quickly.

Keep Your SQL Consistent

Code updates are inevitable. Dependent assets always reference the latest version of your code. This saves time and ensures analytic consistency, granting you the happy confidence of knowing all downstream code has automatically inherited your changes.

Advanced Results Grid Capabilities

Shorten time-to-insight with Coginiti Pro's advanced results grid functionality, which allows users to quickly re-shape query output through aggregations, pivoting, filtering, and light-weight visualizations.

Get New Users Productive Fast

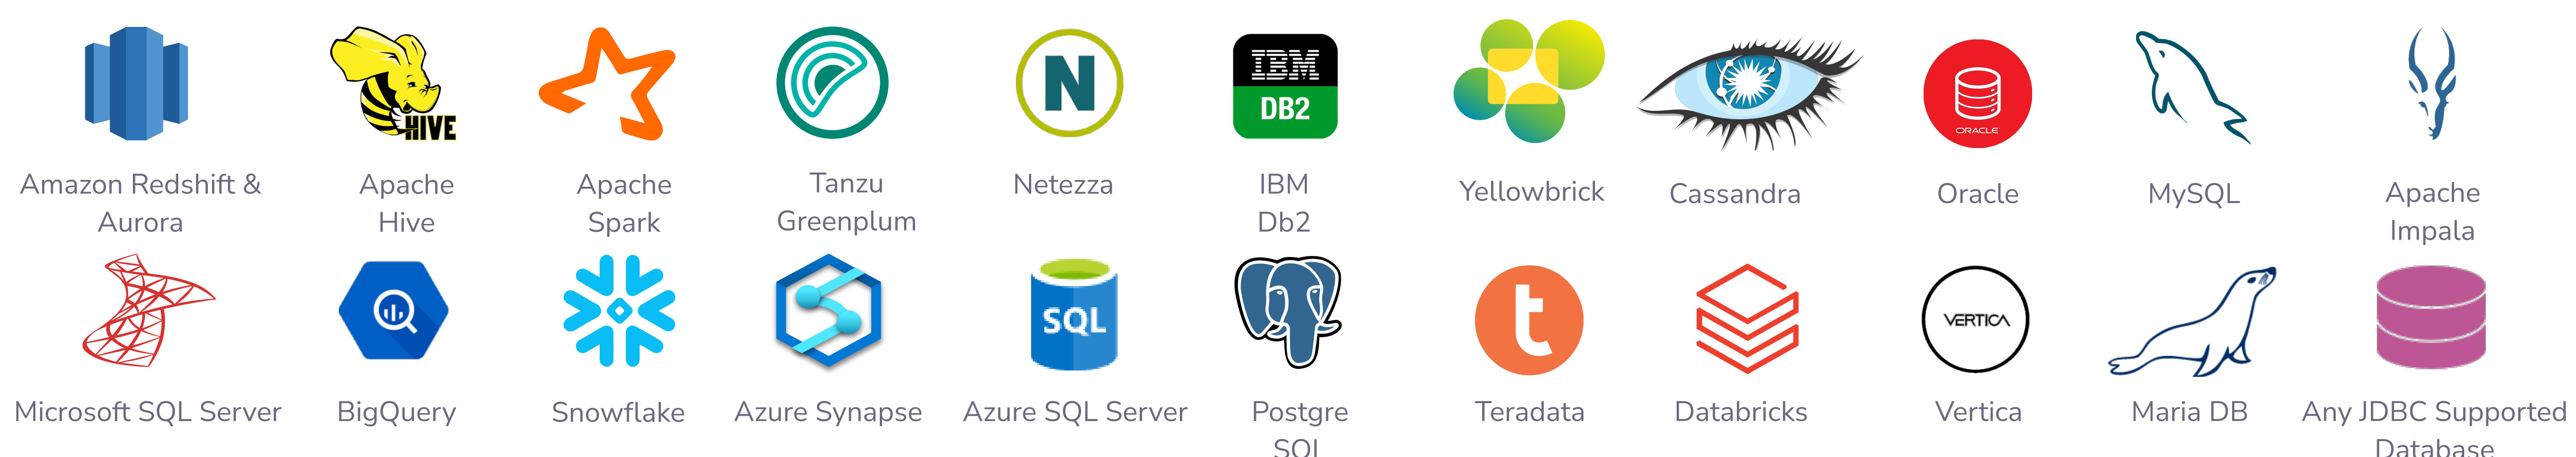

Instead of spending time training your less technical users over and over again, you can export your catalog for your less technical users to leverage your SQL skills in their own version of Coginiti Pro.

Bulk Data Load and Insert Templates

Users love the power of Coginiti's template-driven data upload wizards. Starting from a CSV or Excel file, Coginiti supports native SQL data insert for 100K+ row batches, as well as platform-specific bulk load.

Connect Natively to Both Cloud & On-Premise Databases + Generic JDBC Support for Additional Databases

Coginiti Pro is built on top of our solid analytic foundation spanning 10+ years, with 30K+ users across 2K+ companies, 130 industries, and 55 countries. With Coginiti Pro, data engineers and analysts can collaborate to write and re-use business logic on today's modern on-prem and cloud data platforms. Coginiti removes the friction and waste in data and analytics management, freeing analysts to quickly generate insights to inform decisions and drive business value.
